APPENDIX A

GLOSSARY OF STATISTICAL TERMS

**Analysis** Understanding and explaining an economic problem in terms of the various causes behind it.

**Assumed Mean** An approximate value in order to simplify calculation.

**Attribute** A characteristic that is qualitative in nature. It cannot be measured.

**Bimodal Distribution** A distribution which has two mode values.

**Bivariate Distribution** Frequency distribution of two variables.

**Census Method** A method of data collection, which requires that observations are taken on all the individuals in a population.

**Chronological Classification** Classification based on time.

**Class Frequency** Number of observations in a class.

**Class Interval** Difference between the upper and the lower class limits.

**Class Mark** Class midpoint.

**Class Midpoint** Middle value of a class. It is the representative value of different observations in a class. It is equal to (upper class limit + lower class limit)/2.

**Classification** Arranging or organising similar things into groups or classes.

**Consumer** One who buys goods for one's own personal needs or for the needs of one's family or as a gift to someone.

**Constant** A constant is also a quantity used to describe an attribute, but it will not change during calculation or investigation.

**Continuous Variable** A quantitative variable that can take any numerical value.

**Cyclicity** Periodicity in data variation with time period of more than one year.

**Data** A (often large) set of numbers systematically arranged for conveying specific information on a subject for better understanding or decision-making.

**Decile** A partition value that divides the data into ten equal parts.

**Discrete Variable** A quantitative variable that takes only certain values. It changes from one value to another by finite "jumps". The intermediate values between two adjacent values are not taken by the variable.

**Distribution** Division of national income into wages, rents, profits and interests.

**Economics** Study of how people and society choose to employ scarce resources that could have alternative uses in order to produce various commodities.
that satisfy their wants and to distribute them for consumption among various persons and groups in society.

**Enumerator**  A person who collects the data.

**Exclusive Method**  A method of classifying observations in which an observation equal to the upper class limit of a class is not put in that class but is put in the next class.

**Frequency**  The number of times an observation occurs in raw data. In a frequency distribution it means the number of observations in a class.

**Frequency Array**  A classification of a discrete variable that shows different values of the variable along with their corresponding frequencies.

**Frequency Curve**  The graph of a frequency distribution in which class frequencies on Y-axis are plotted against the values of class marks on X-axis.

**Frequency Distribution**  A classification of a quantitative variable that shows how different values of the variable are distributed in different classes along with their corresponding class frequencies.

**Inclusive Method**  A method of classifying observations in which an observation equal to the upper class limit of a class is put in that class.

**Informant**  Individual/unit from whom the desired information is obtained.

**Multi Modal Distribution**  The distribution that has more than two modes.

**National Income**  Total income arising from what has been produced in the country. It is also called Gross National Product.

**Non-Sampling Error**  It arises in data collection due to (i) errors in measurement, (ii) recording mistakes, (iii) non-response.

**Observation**  A unit of raw data.

**Percentiles**  A value which divides the data into hundred equal parts so there are 99 percentiles in the data.

**Policy**  The measure to solve an economic problem.

**Population**  Population means all the individuals/units for whom the information has to be sought.

**Producer**  One who manufactures goods for the market.

**Production**  The act of manufacturing goods.

**Qualitative Classification**  Classification based on quality. For example classification of people according to gender, marital status etc.

**Qualitative Facts**  Economic information or data expressed in terms of qualities.

**Quantitative Facts**  Economic information or data expressed in numbers.
APPENDIX A

**Questionnaire**  A list of questions prepared by an investigator on the subject of enquiry. The respondent is required to answer the questions.

**Random Sampling**  It is a method of sampling in which the representative set of informants is selected in a way that every individual is given equal chance of being selected as an informant.

**Range**  Difference between the maximum and the minimum values of a variable.

**Relative Frequency**  Frequency of a class as proportion or percentage of total frequency

**Sample Survey Method**  A method, which requires that observations are obtained on a representative set of individuals (the sample), selected from the population.

**Sampling Error**  It is the numerical difference between the estimate and the true value of the parameter.

**Scarcity**  It means the lack of availability.

**Seasonality**  Periodicity in data variation with time period less than one year.

**Seller**  One who sells goods for profit.

**Service-holder**  One who gets paid for a job or for working for another person.

**Service Provider**  One who provides a service to others for a payment.

**Spatial Classification**  Classification based on geographical location.

**Statistics**  The method of collecting, organising, presenting and analysing data to draw meaningful conclusion. Further, it also means data.

**Structured Questionnaire**  Structured Questionnaire consists of “closed-ended” questions, for which alternative possible answers to choose from are provided.

**Tally Marking**  The counting of observations in a class using tally (/) marks. Tallies are grouped in fives.

**Time Series**  Data arranged in chronological order or two variable data where one of the variables is time.

**Univariate Distribution**  The frequency distribution of one variable.

**Variable**  A variable is a quantity used to measure an “attribute” (such as height, weight, number etc.) of some thing or some persons, which can take different values in different situations.

**Weighted Average**  The average is calculated by providing the different data points with different weights.
